

1. idea introduction

In South Korea, Especially Seoul has two convenient public transportation. It is subway and bus. so I want to make that providing convenience about using transportation. I will make android application but many application already exist. So my app has specific function. If people transfer bus or subway when they go destination. they will wait for it. because of that I will make fuction that showing the time what people don't wait for tranfer time.

Existing application

My application

If people search their way then their request into server's queue. If time will go then server push message refresh information about their request.

2. Development plan

Divided into two sides that server and client.

Client side:

I will make android application and use seoul transportation api.

Server side:

I will use IBM Bluemix vm service.
